

TERMINACIÓN DE PROGRAMAS

exit(0) indicates successful program termination & it is fully portable, while *exit(1)* (usually) indicates unsuccessful termination. You can use different values other than 1 to differentiate between different kind of errors. The most suitable way to indicate a type of error is to consult the documentation associated with the function invoked, and consult the environment variable *errno* if it is necessary

Note that the C standard defines *EXIT_SUCCESS* and *EXIT_FAILURE* to return termination status from a C program.

0 and EXIT_SUCCESS are the values specified by the standard to indicate successful termination, however, only *EXIT_FAILURE* is the standard value for returning unsuccessful termination. *1* is used for the same in many implementations though.
